

MATH0003 Analysis 1

<i>Year:</i>	2026–2027
<i>Code:</i>	MATH0003
<i>Level:</i>	4 (UG)
<i>Normal student group(s):</i>	UG: Y1 Mathematics programmes
<i>Value:</i>	15 credits (7.5 ECTS credits)
<i>Term:</i>	1
<i>Assessment:</i>	70% examination, 20% coursework, 10% departmental test(s). The departmental test is a midsessional exam in January. The coursework is divided into 15% analysis coursework and 5% Proofs and Foundations coursework. In order to pass the module you must have at least 40% for both the examination mark and the final weighted mark.
<i>Normal Pre-requisites:</i>	A* in A-level Mathematics and Further Mathematics
<i>Lecturer:</i>	Prof M Hadzic

Course Description and Objectives

Starting only with the basic properties of real numbers, rigorous proofs are given of the main results in elementary differential calculus. Topics covered include sequences, series, continuity and differentiability of functions and the properties of the exponential function.

This course has two main aims:

1. To begin the study of analysis, continued in MATH0004 and MATH0013. Mathematical analysis is one of the most important and well-developed strands of pure mathematics with many elegant and beautiful theorems, and also with applications to many areas of mathematics and mathematical physics.
2. To introduce students to the ideas of formal definitions and rigorous proofs (one of the fundamental features of modern mathematics, and something that is not familiar from A-level), and to develop their powers of logical thinking.

Recommended Texts

The recommended text is:

- Haggarty, *Fundamentals of Mathematical Analysis*, 2nd ed (Pearson)

Additional recommended books include:

- KG Binmore, *Mathematical Analysis: A Straightforward Approach* (Cambridge)
- M Spivak, *Calculus* (Publish or Perish)
- R Bartle and D Sherbert, *Introduction to Real Analysis* (Wiley)
- MH Protter and CB Morrey, *A first course in real analysis* (Springer)

Detailed Syllabus

- Basic properties of $\mathbb{R}$: least upper bounds.
- Sequences and convergence. Monotone sequences. The Bolzano-Weierstrass theorem.
- Series and convergence tests. The binomial theorem and the exponential series.
- Functions. Boundedness and continuity, the intermediate value theorem and inverses. The logarithm and powers.
- Differentiation. Definition and basic properties; the chain rule etc. The derivatives of the exponential and logarithm.
- Rolle's Theorem and the Mean Value Theorem.

Proofs and Foundations course

The Proofs and Foundations course is designed to introduce students to the foundational aspects of pure mathematics alongside developing mathematical writing skills. Students will study Mathematical Logic, Set Theory, Functions, Mathematical Proof, and Cardinality. There will be an emphasis on clarity and precision of mathematical writing in live sessions and assessment.
